# Assignment 3 Part 1 Instructions

## Assignment 3 Part 1: System Calls

### Github Classroom Link:

Please find the link to create your repository for this assignment in the "Github Classroom Links" section under course resources

### Github Classroom Start Instructions

For this assignment we will start with the git repo we created for the previous assignment, but change the origin to point to the github repo where we will submit the next assignment. We will also pull in some base code used for assignment 3.

### Use these commands in git bash to prepare your assignment repository:

```
git remote remove origin
```

- This removes the origin repository you used to submit the previous assignment

```
git remote add origin <url>
```

- Substitute <url> for the repository created with the github assignment link for the current assignment.
- This is where you will submit your current assignment. It will be configured as origin so git push origin master will push to this repository.

```
git fetch assignments-base
```

- Fetch the latest content from the starter code remote added during assignment 2
- This step assumes you've already created the remote using `git remote add assignments-base git@github.com:cu-ecen-aeld/aesd-assignments.git` in assignment 1 or 2. If you started from a new repo you'll need to re-run the git remote add step before attempting to fetch.
